This looks like a pretty good hackathon submission. Obviously, you didn't get the app to use the GPS location in the URL, and thus you're retrieving data for a fixed location. However, you really weren't far away from a fully working solution.

I liked the code for displaying the results in a `TableLayout`, although you should have made better use of the `strings.xml` file.

Overall, though, you got a good amount done under a tight time constraint. You can be happy with the work,
